

Hyperbaric Oxygen Therapy Regina

Hyperbaric Oxygen Therapy Regina - Therapy referred to as oxidative therapy is performed by introducing extra energy within the body. The three ways which this may be accomplished is to introduce oxygen into the body under pressure utilizing Hyperbaric Oxygen, through combining ozone gas in with the blood, or by infusing Hydrogen Peroxide or H₂O₂ into a vein. It only takes a small amount of Hydrogen Peroxide to produce a large amount of oxygen, therefore, areas on the body that suffer from poor circulation can benefit greatly from the supply of oxygen.

Oxidative Therapy has been around for many years. In the year 1920, Dr. T.H. Oliver first made use of Intravenous Hydrogen Peroxide during an outbreak of influenza pneumonia. This successful treatment helped numerous patients and results were reported in the Lancet, a British medical journal. A few years later, Dr. Charles Farr published a paper entitled "Therapeutic Use of Intravenous Hydrogen Peroxide." This particular paper has become the protocol for physicians who administer H₂O₂.

There are different theories that exist to describe how this therapy works. Researchers and Scientists are currently discovering that the presence of H₂O₂ within the body is more complex than initially believed. The benefits of Oxidative Therapy have been show effective for the following health illnesses: Cerebrovascular Disease, Cardiovascular Disease, Coronary spasm, Cardiac arrhythmia, Asthma, Peripheral Vascular Disease, Pulmonary Diseases, COPD, Influenza, Raynaud's Phenomenon, Chronic Bronchitis, Bronchiectasis, HIV, Herpes Simplex, Immune Diseases, Lupus, Multiple Sclerosis, Alzheimer's, Fibromyalgia, Chronic Fatigue, Environmental Poisonings, Rheumatoid Arthritis, Migraines, and Parkinson's Disease, among others.

Because oxidation is a very important energy producing chemical response in the body that utilizes different kinds of oxygen, the treatment should be carefully controlled so as to prevent damage to surrounding normal tissue. Anti-oxidants in the form of enzymes and vitamins protect the body from oxidative damage. On the other hand, the immune system utilizes oxidative energy as a weapon in order to directly kill infectious agents like for example yeast, bacteria, parasites and viruses.
