

Psychotherapy Regina

Psychotherapy Regina - Neural Therapy started with the Walter and Ferdinand Huneke, physicians from Germany. They initially called it "Heilanasthesie" which can be translated to "curative anaesthesia." The name was later changed to "segmental therapy," or "Segmenttherapie," before finally becoming "neural therapy," after Huneke. Neural Therapy is a system utilized to diagnose and treat medical problems of patients that are otherwise resistant to treatment or difficult to treat.

This particular therapy is based upon the theory that trauma is capable of producing long-standing interruptions within the electrochemical function of tissues. There are various tissue types which can be affected by trauma comprising nerves, a ganglion, that is a bunch of nerves and scars. There is no scientific evidence showing that neural therapy is effective in treating whichever sickness or cancer, although, it has been utilized to be able to treat pain disorders. Neural therapy is mostly practiced in Europe and South America.

History

Ferdinand Huneke was a surgeon in Germany who launched a new pain medicine during the year 1925. It contained a local anaesthetic known as Procaine. He tried it on his sister who suffered from severe intractable migraine. He injected it intravenously rather than the recommended intramuscular way. The migraine attack stopped immediately. This response impressed his brother Walter and him. They used Novocaine and Procaine and occasionally blended it together with caffeine called "Impletol." This is still utilized these days in migraine medicines. It has been found to be really helpful in numerous painful conditions either by means of IV or local injection.

During the year 1940, Ferdinand Huneke injected the painful shoulder of a lady who likewise suffered osteomyelitis in her leg. During that time as there were no antibiotics available, she was threatened with amputation. The shoulder pain somewhat improved but the leg wound became itchy. The next treatment, he injected the leg wound and the shoulder pain vanished right away. This kind of response is called "Flash Phenomenon."
